

CSI247: Lab 3 – Arrays and Sorting (7 - 9 am)

At the end of this lab you should be able to:

- Implement an interface
- Implement inheritance
- Implement the Comparable interface
- Overriding super class method.
- Follow proper java project folder structure and compile from the command line.
- Create and use arrays

Lab Question

In this lab, you will implement a Comparable class and then create an array for objects of that class. You will also implement a sorting method and use it to sort the array. You should start by creating the proper project structure for this lab. Call the project *lab3*.

SellableItem

- Create an class called *SellableItem* in a package called *lab.sellable*.
- The class should implement the comparable.
- The class will have the following properties:
 - A barcode that identifies the object uniquely among other items.
 - A name of the item
 - A description of the item
- Implement the *compareTo* method to compare the *SellableItem* objects using the barcode.
- Override the *toString* method.

Tester Class

- Create a class called *Tester* in the *lab* package.
- Create the main method.
- Declare an array of *SellableItem* objects. Create the array to host 6 items.
- Create 6 *SellableItem* objects and add them to the array.
- Print the items as they are in the array.
